This passage is about a forest fire which burned many trees. In the recent decades, people have cut down a lot of trees in forests for having empty places of building house, roads, and for ^{timber} obtaining woods to make money. Frequent forest fires ^{made} ~~make~~ the matter worse. Some forest fires ^{are} ~~is~~ caused by accidents, and most ~~is~~ caused by extremely hot weather because of the changes of weather patterns. One remedy for compensating lost tree ^{trees} is to plant new trees quickly, but ~~this~~ ^{these} takes years to grow. Some researchers think the final solution is to stop ~~the~~ global warming by reducing carbon dioxides gas emission, which means we should decrease industrial activities, use less cars, etc. This can make us healthy as well. However, some studies show that forest fire is a process ^{natural} ~~of nature~~ ^{involves survival of the fittest} ~~that the fittest survive~~. Thus, there is no need to put out forest fire, and the best strategy is to let them burn ~~after fire~~ because new and better trees will grow and this way is more sustainable. I strongly believe that people should make efforts to avoid man-made forest fires, ~~and~~ take measures to ~~less~~ ^{lessen} the greenhouse gases emission, and plant more trees.
